File naming	4
File organization	5

File Naming

Source Code

All source code .zip files should be named using the following format (replacing <> with the appropriate information and the X's with the version number):

<Project name>-vX.X-source.zip

Binaries (.zip)

All binary .zip files should be named using the following format, using the same substitutions as for the source code.

<Project name>-vX.X-bin.zip

Binaries (.msi)

All Windows installer (.msi) files should be named using the following format, using the same substitutions that have been previously stated.

<Project name>-vX.X-setup.msi

File Organization

In order to keep the large amounts of source code and binaries organized, certain rules must be followed. Those include the following:

- Files should never be placed outside of the project or version folder.
- The folder containing the source code (inside the .zip) must always be *main* to show that it is the root of the source code.
- If a .msi must be compressed, the name of the installer must still be changed to match the formatting specified on page 3.
- If a project doesn't get properly versioned releases, it must have an *all* folder, as shown below in Figure 1.

Figure 1

Figure 2

- If a project does get properly versioned releases, then it must have a folder for each major release (ex. 1.X, 2.X), as shown above in Figure 2.
